

JOMY®
L A D D E R

THE UNIVERSAL FOLDING
EMERGENCY LADDER

JOMY

THE JOMY LADDER UNIVERSAL ESCAPE SYSTEM

GOOD LOOKING AND UNOBTRUSIVE

The ladder is very small: folded back, all that can be seen is a column about 10 cm in size, comparable to a downpipe.

It can thus integrate perfectly with both old and new buildings, even on the principal facade.

The exposed surfaces may be painted (in any colour).

APPLICATIONS

Fire escape equipment.

Providing exterior access for the fire brigade and rescue services.

GUARANTEED OPERATION IN ALL WEATHER CONDITIONS

Constructed in anodized aluminium alloy (Al, Mg, Si), stainless steel and nylon, it requires no special maintenance.

The ladder and its opening mechanism have been tested at abnormally high temperatures and submitted to alternating wet and immediate freeze-thaw cycles at -40 °C in a cold chamber.

The opening mechanism continues to function and the ladder is deployed normally in both these extremes of climate.

SIMPLE AND QUICK OPERATION

A simple quarter-turn of the operating handle located at the level of one of the emergency exits and the ladder unfolds over its full height.

The unfolding action is dampened by stainless steel compensating springs which also help in folding the ladder back after use. A side guard rail located in the exterior upright is opened by hand to protect the user on his descent.

Options: The JOMY ladder may be opened by an electric drive with controls at each level and supplied by a fire alarm and detecting system or by a 24 V permanent rechargeable battery.

PROTECTION AGAINST MISUSE

The control lever at the ground level may be removed and the opening mechanism protected by a padlocked cover. This protection does not prevent the ladder being deployed from the other levels. At its base, the ladder may be located in an «anti-climb» U-channel over a height of about 3 m. An alarm sensor and/or a floodlight, triggered by the operation of the ladder, may be installed.

CERTIFICATIONS

The JOMY ladder has passed laboratory tests in the Benelux countries, the Federal Republic of Germany, in the USA, in Japan ... It is also advised, or even recommended, by the emergency services in many countries.

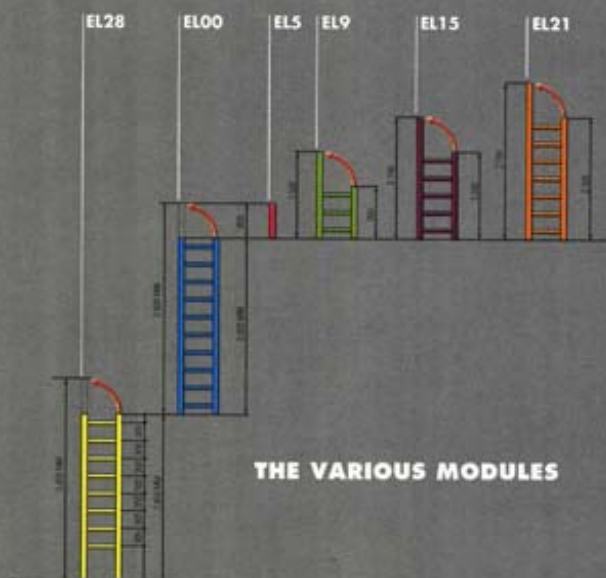

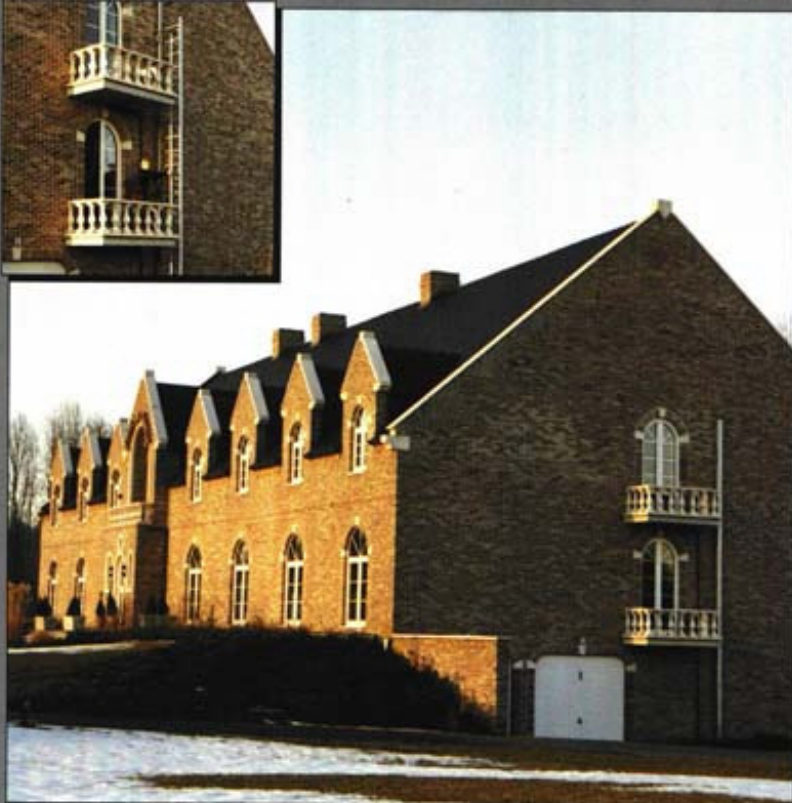

INSPECTION AFTER INSTALLATION

In Belgium, each installation of a JOMY ladder is subject to a verification report by the AIB Vinçotte certification body.

Thanks to its
good looks,
the JOMY
emergency
ladder
harmonizes
with modern
architecture...

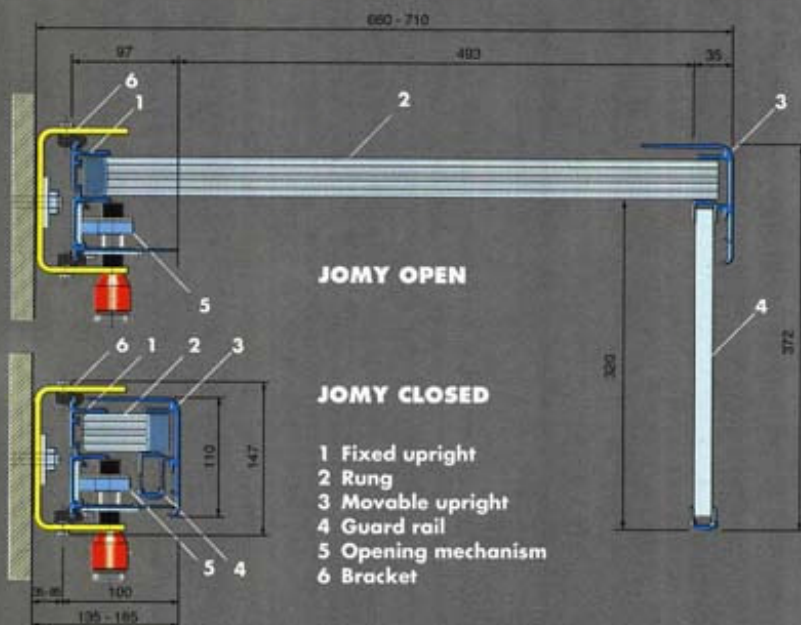

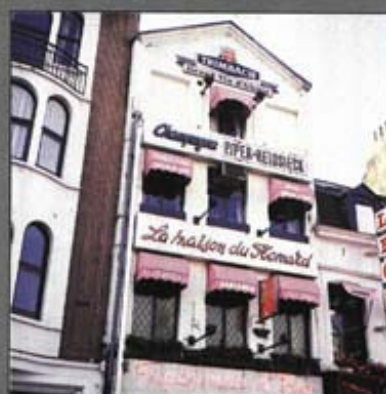

TECHNICAL SPECIFICATION

The JOMY ladder is constructed from standard modules (see neighbouring diagram) which can be assembled to create the height required (minimum 2.85 m). The opening mechanisms may be fitted at positions selected from holes pre-drilled every 30 cm along the flange of the fixed upright.

STRENGTH

Tests carried out and periodically repeated by (UL) in the USA demonstrate that the rungs do not show any permanent deformation when a load of 1000 lbs (453 kg) is imposed on their centre. The uprights can resist a thrust of 5 t without buckling (AIB tests).

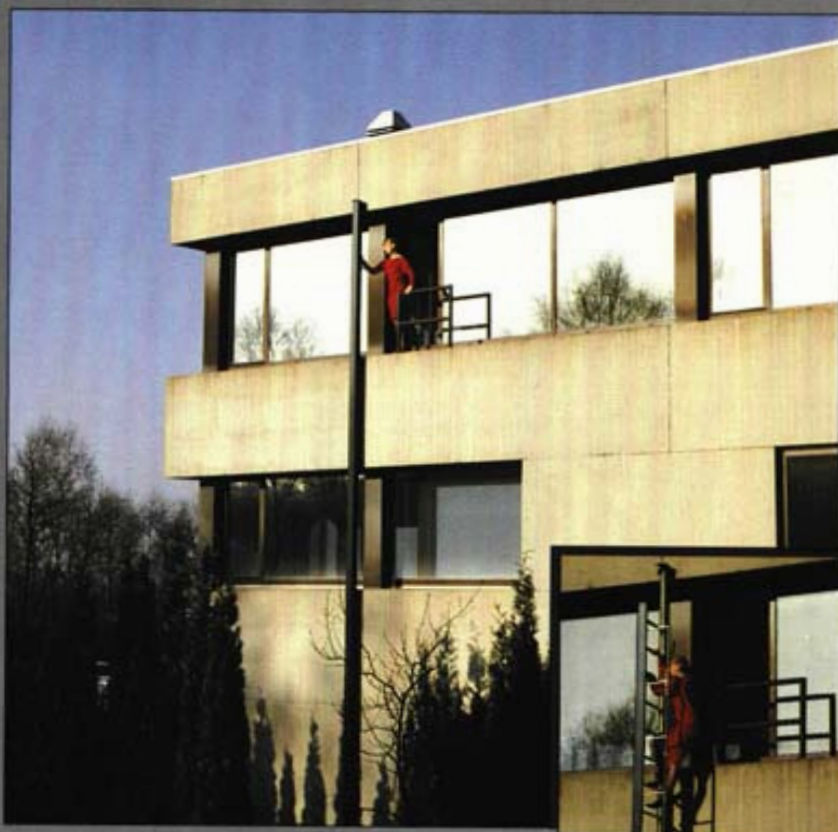

The fixed upright of the JOMY ladder is held in special stirrups which allow it free expansion. These stirrups are aligned vertically and fixed to the wall by expanding bolts, which can resist a tensile force of at least 4 kN. The stirrups are spaced about 1.5 m apart.

.... and old
architecture.
Its perfect
integration
into the facade
and its
unobtrusiveness
do not mar
the appearance
of the building.
